

# Armazones 2k climatology

Tomek Bulik

# What do we know

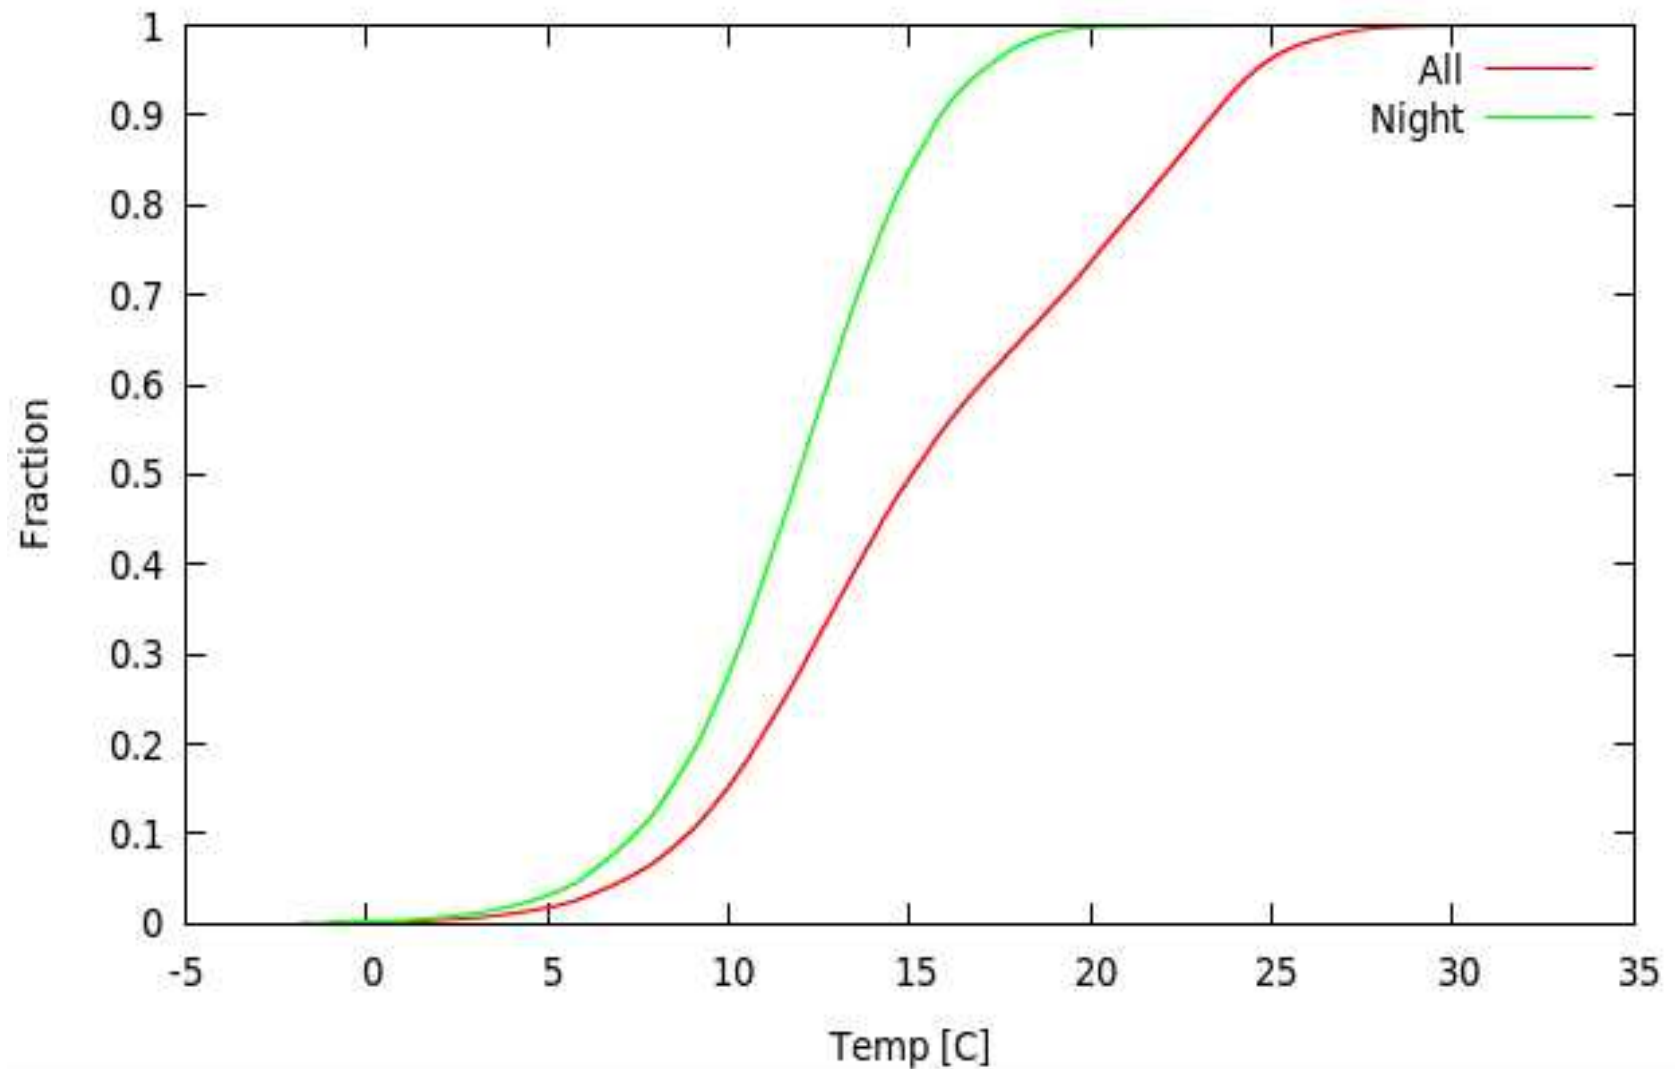

- Armazones: Atmoscope
- Armazones 2k:
  - Atmoscope like stations since May2015
  - November 2015:
    - 30 meter weather tower
    - ASC
    - Sun Moon photometer
    - Seismometer

# 10 meter station results

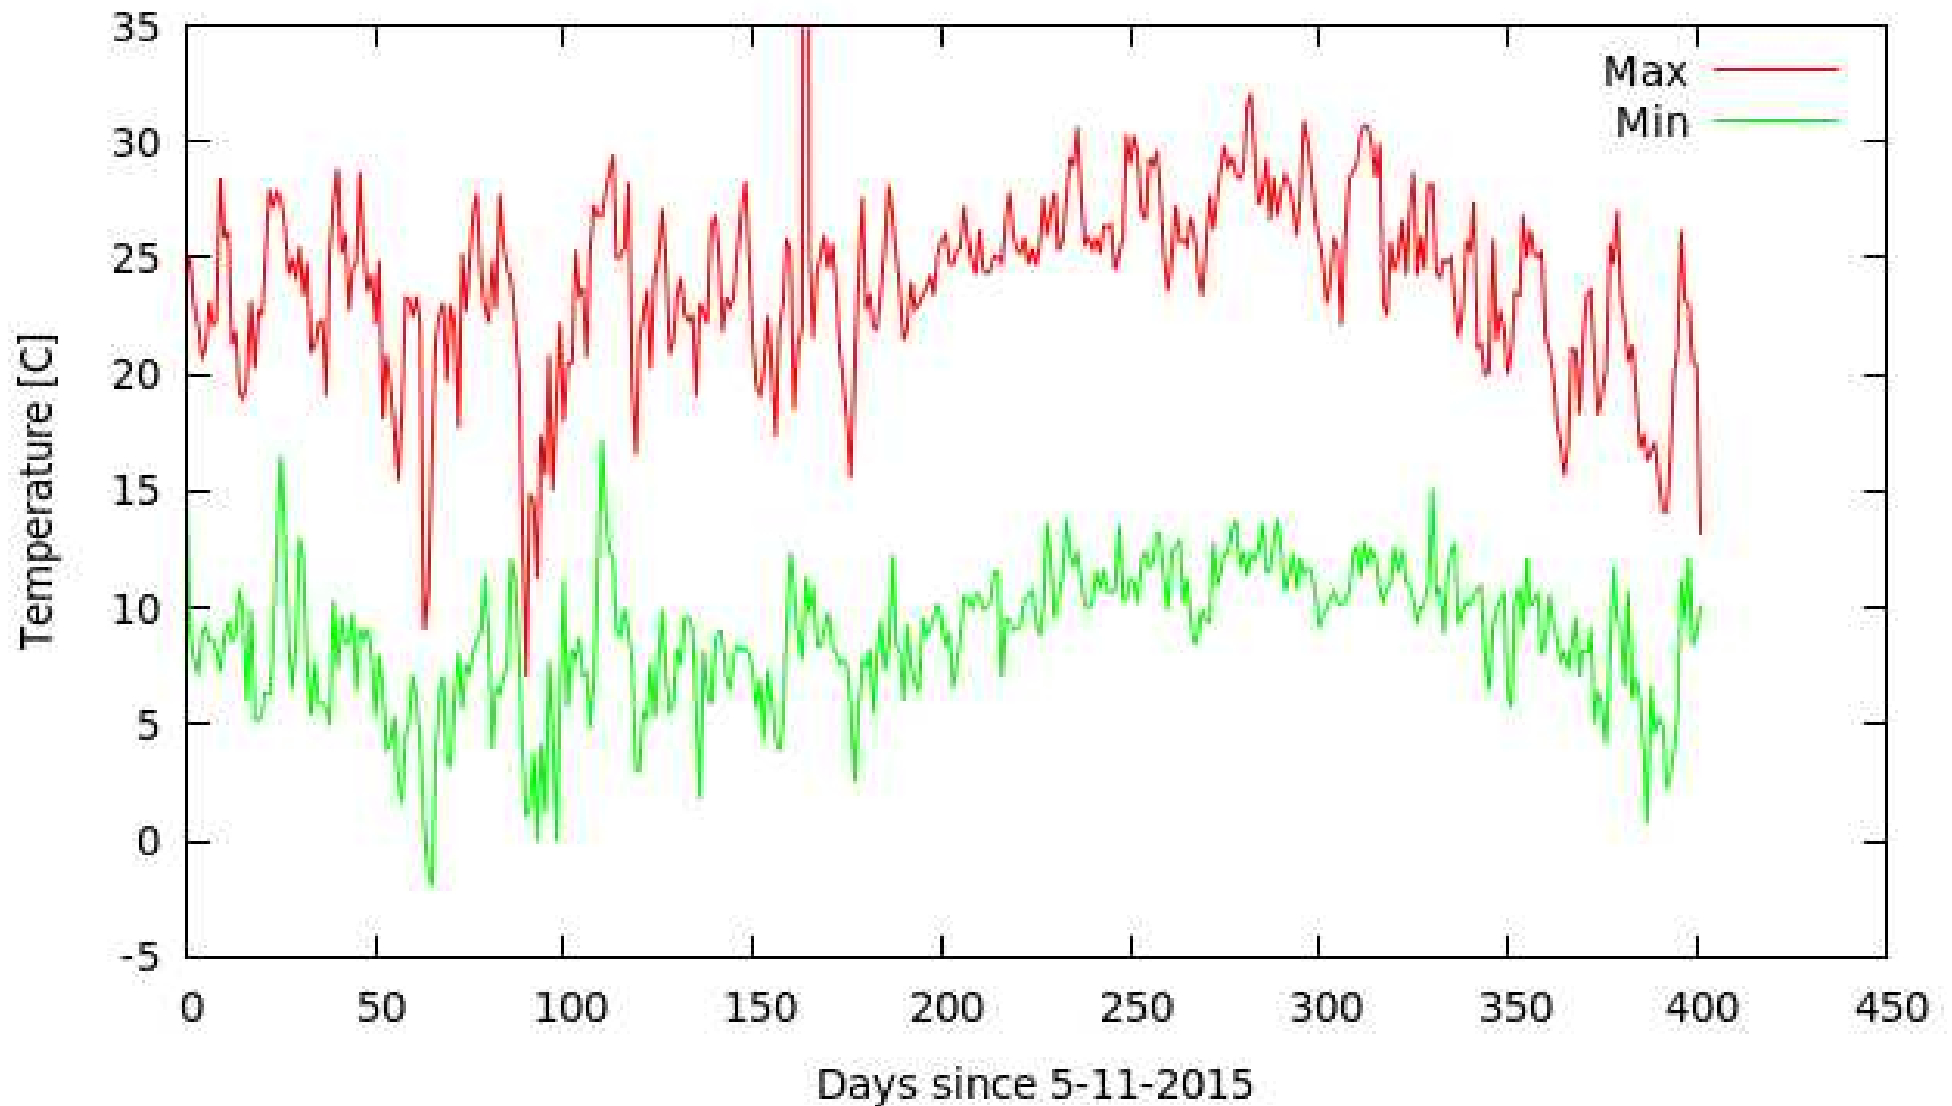

- Temperature
- Humidity
- Wind

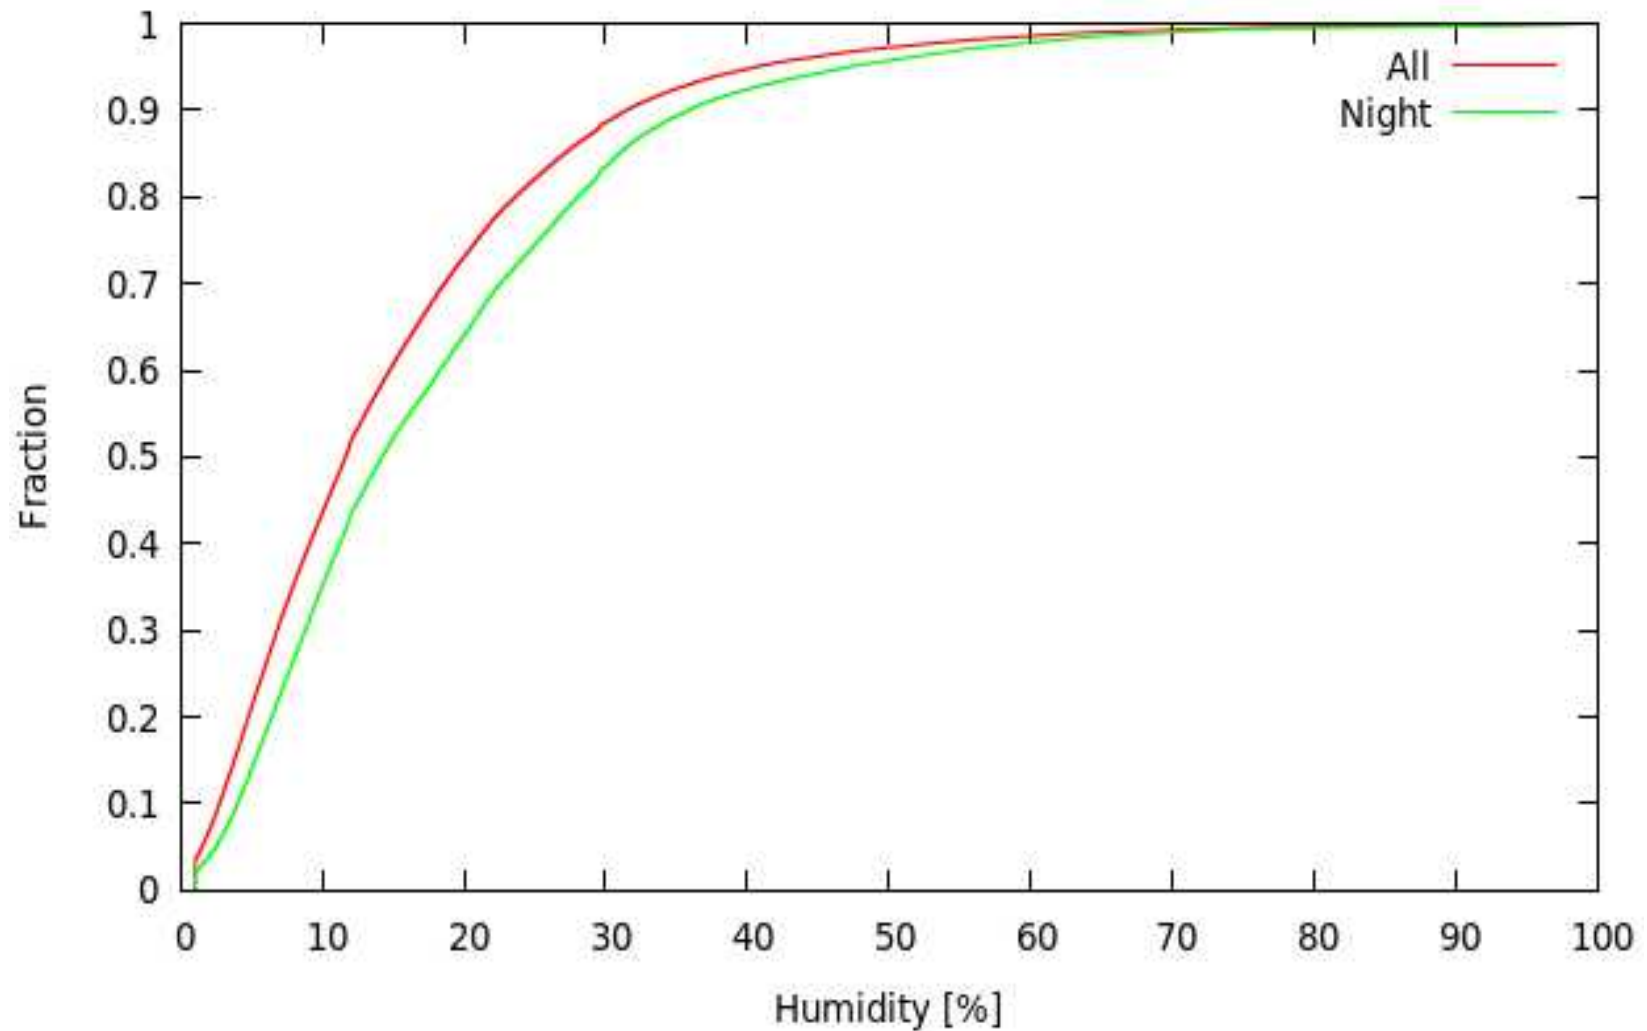

# Temperature distribution

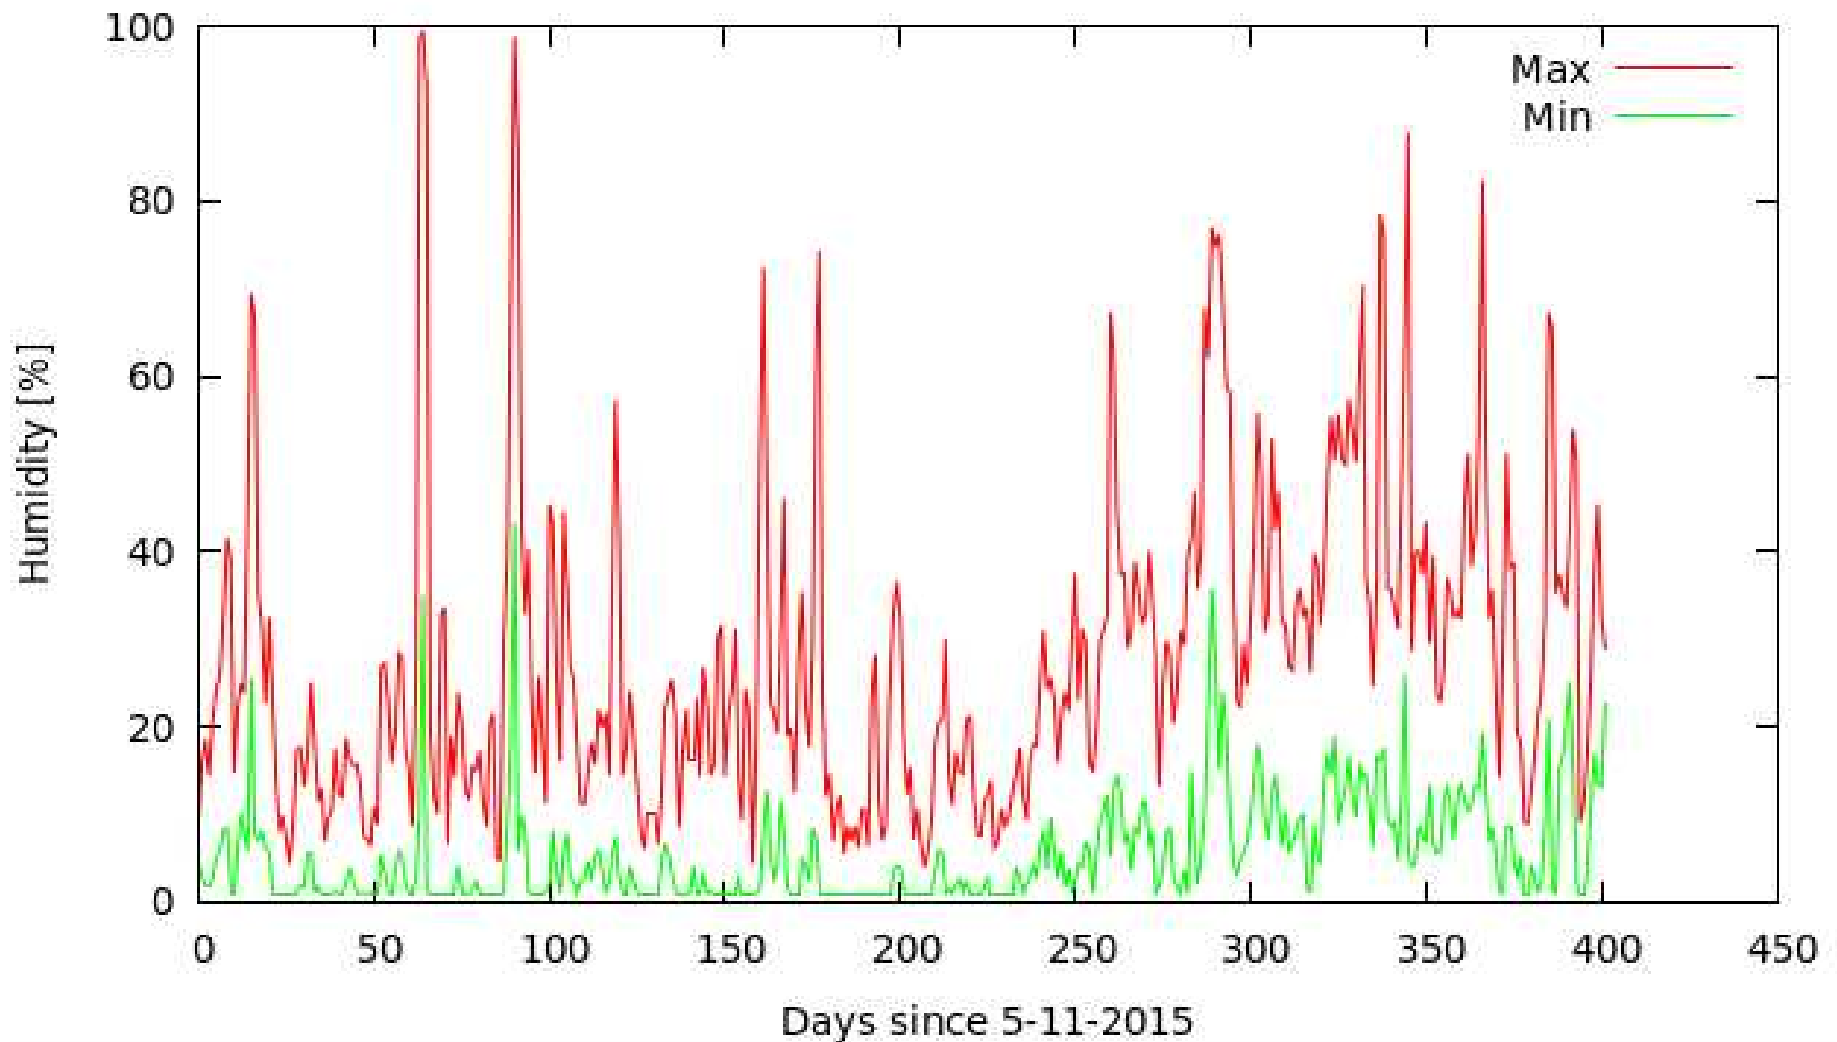

# Temperature extremes

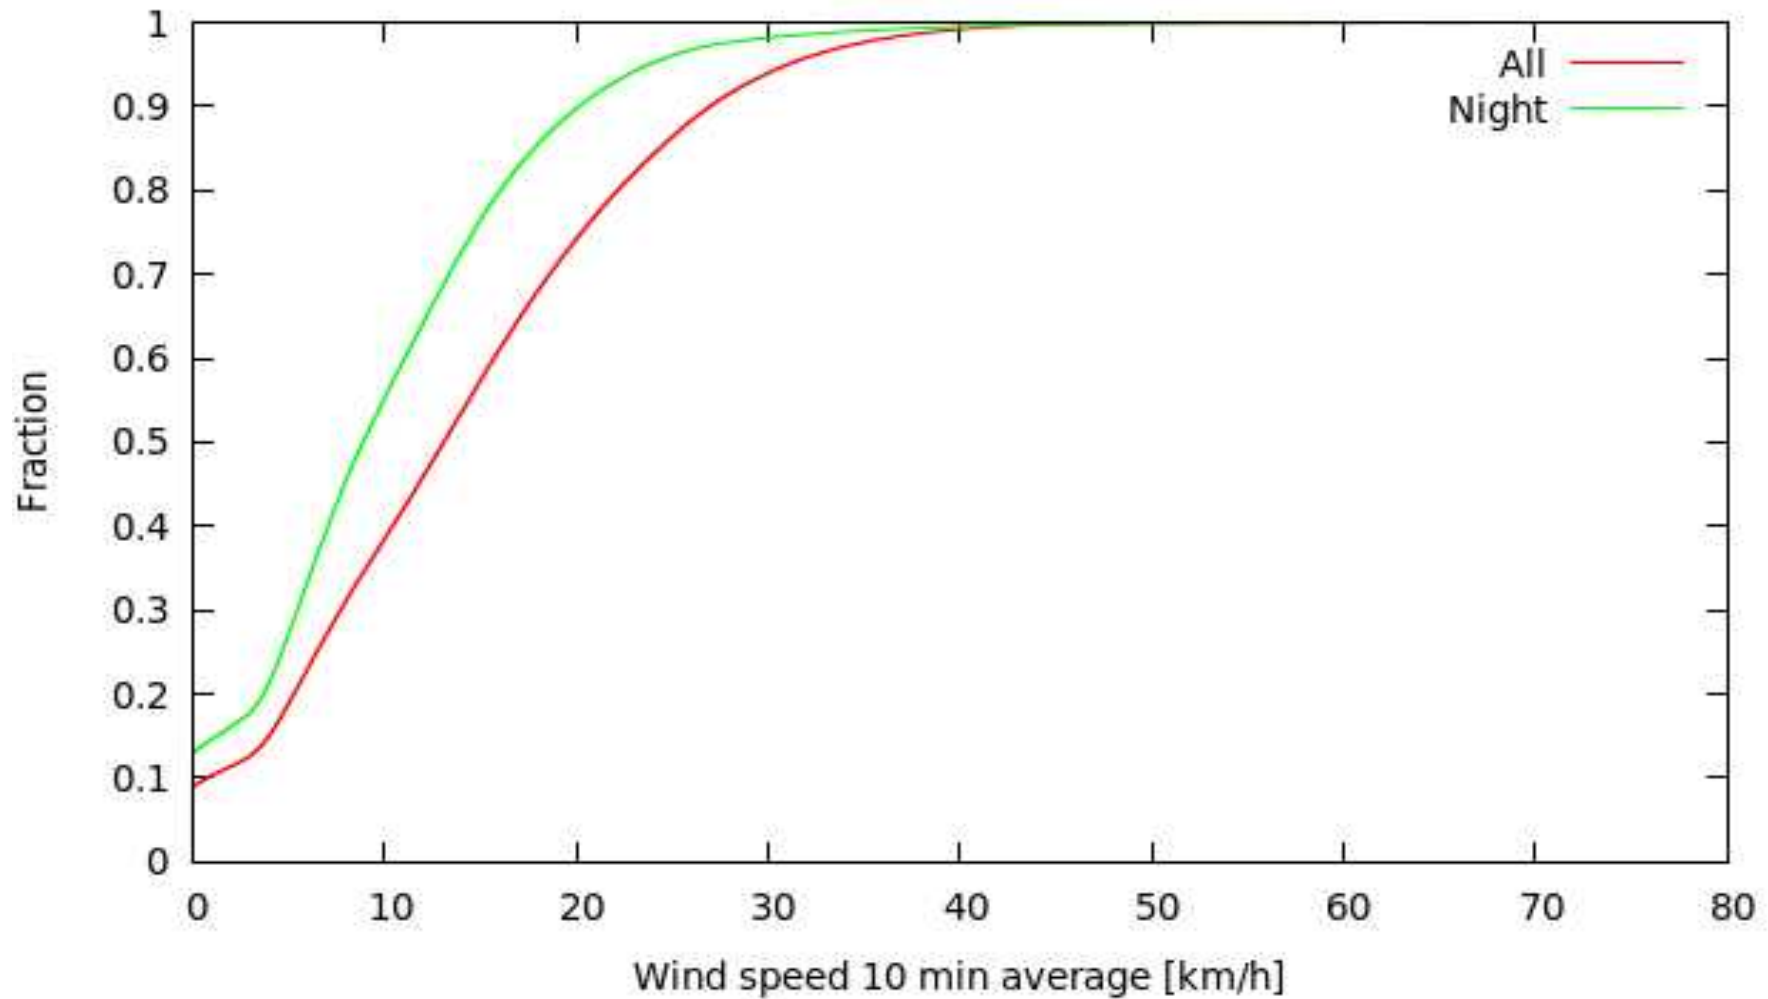

# Humidity distribution

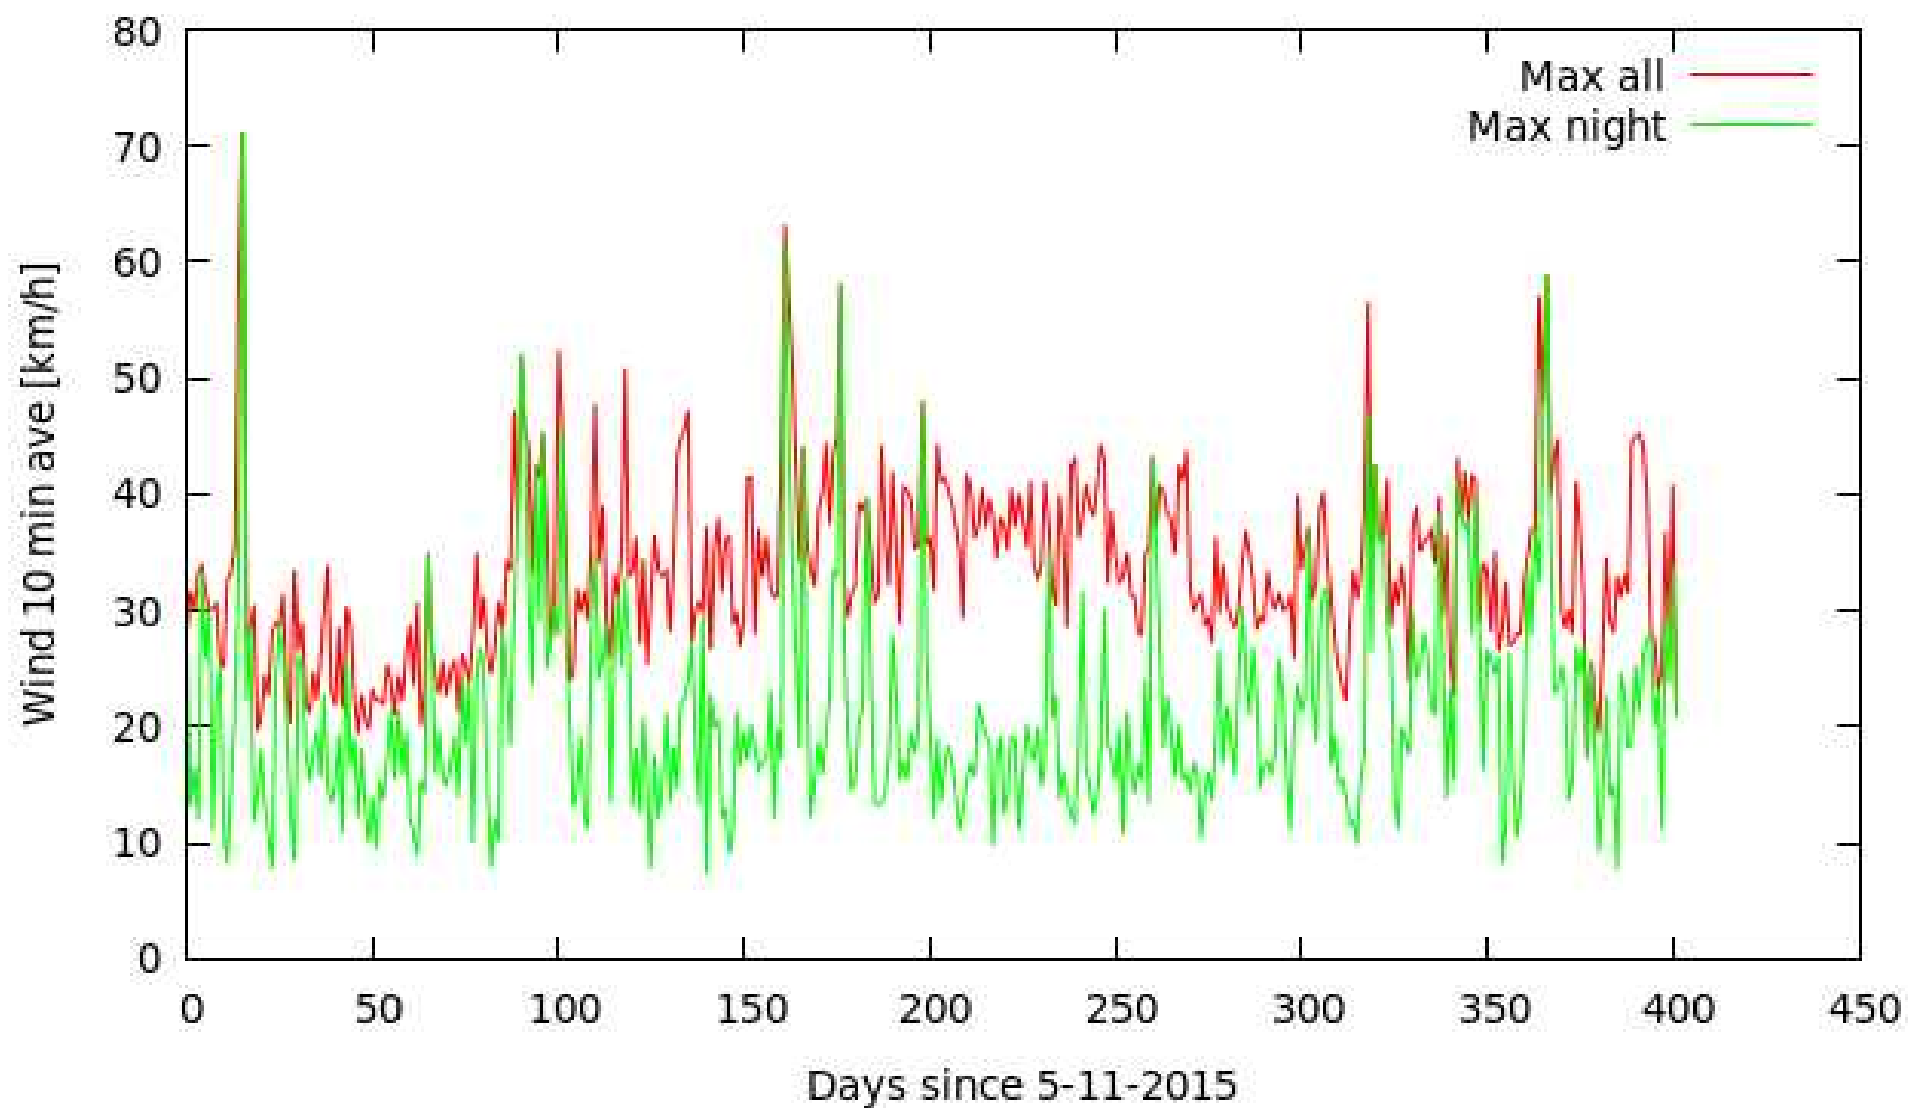

# Humidity extreme

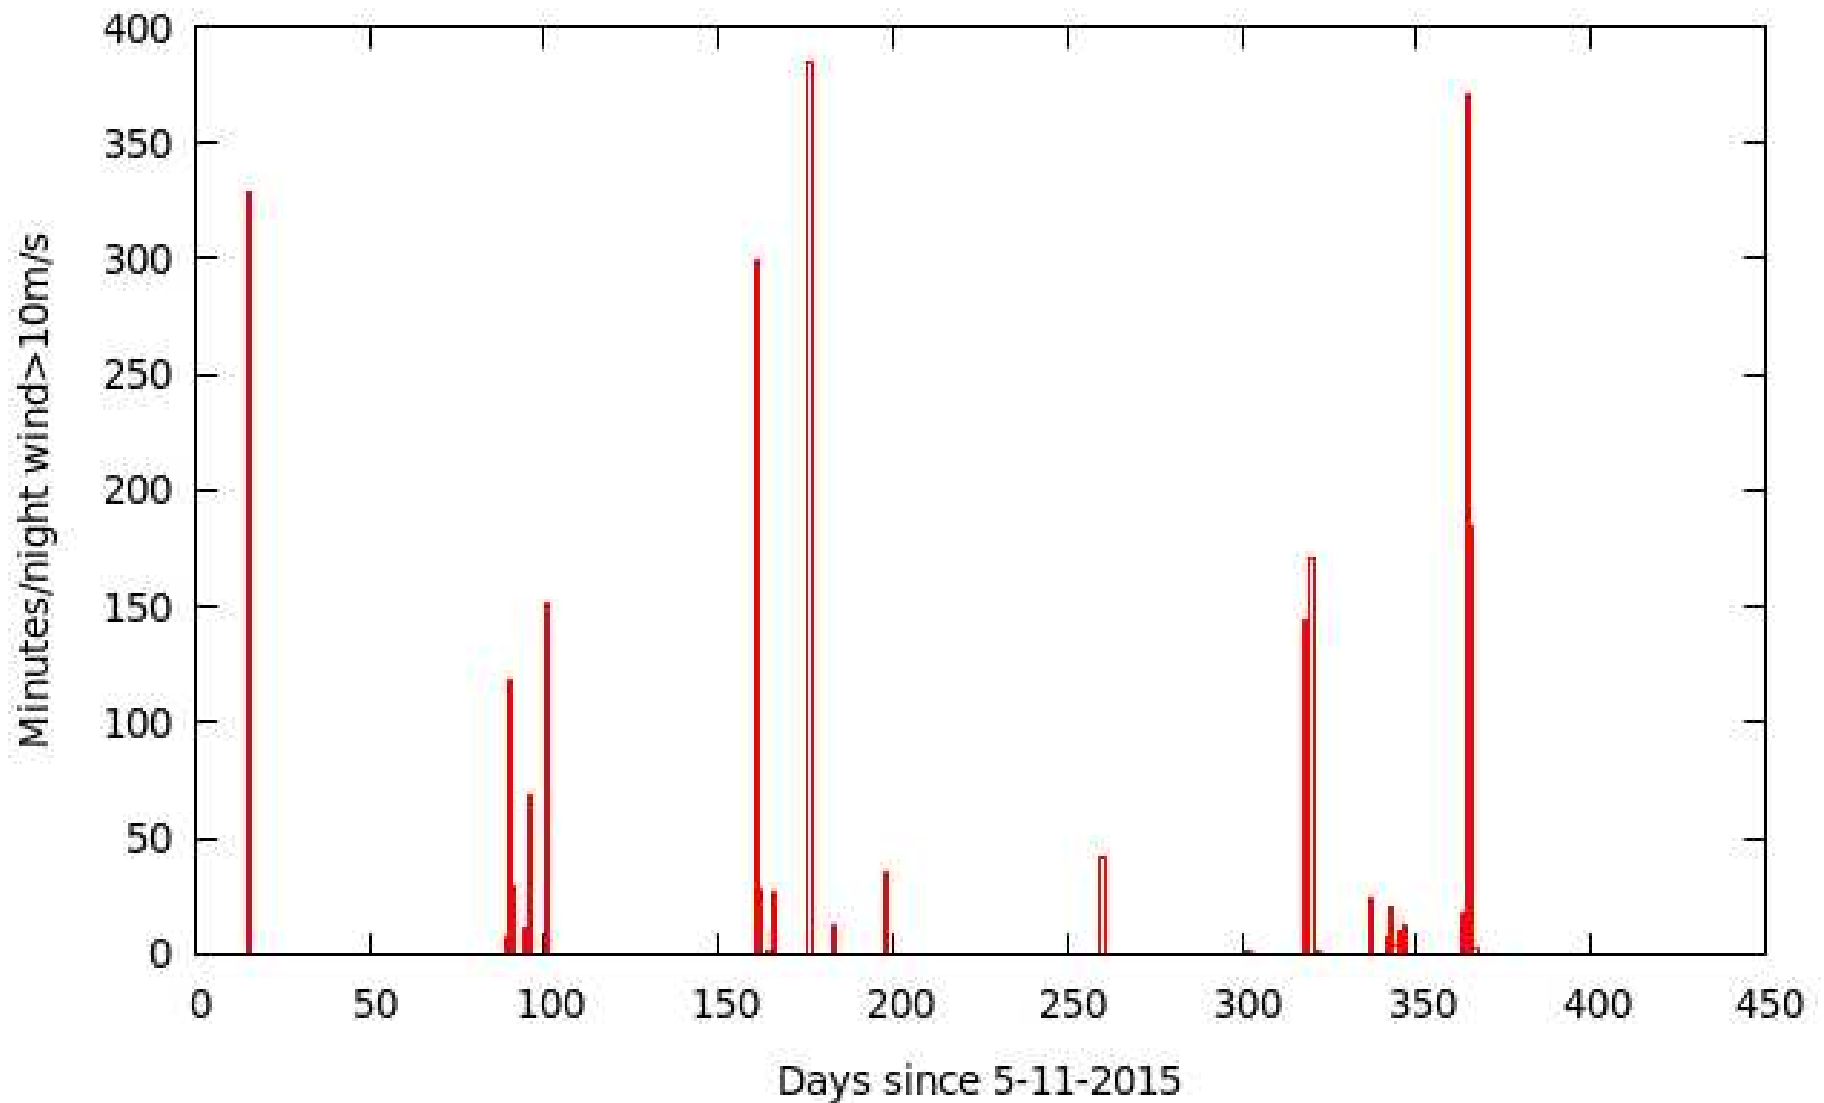

# Wind distribution

# Wind extremes

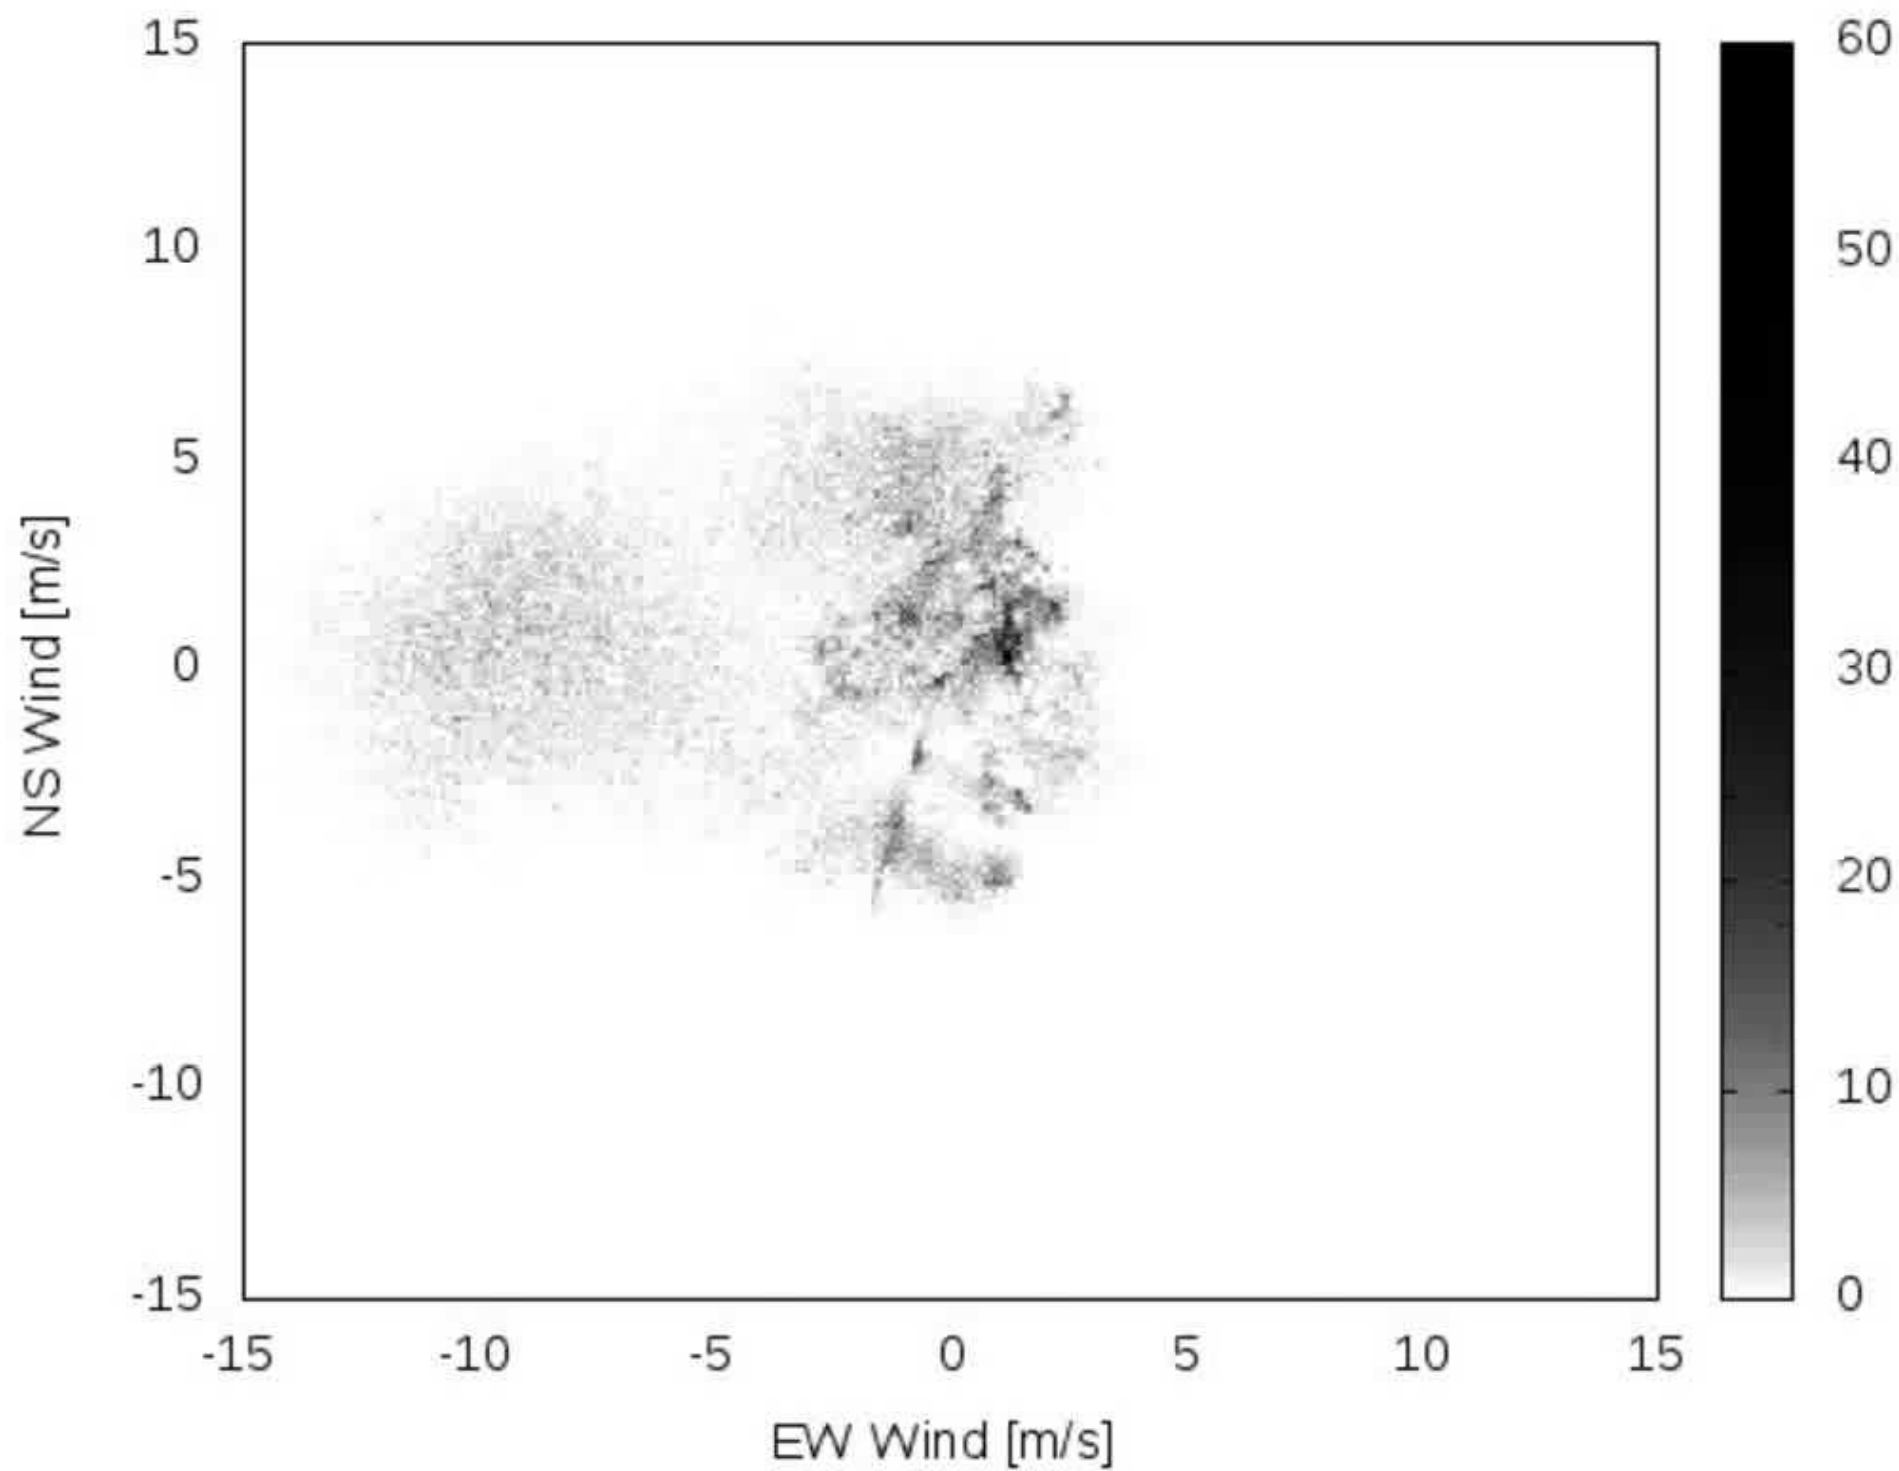

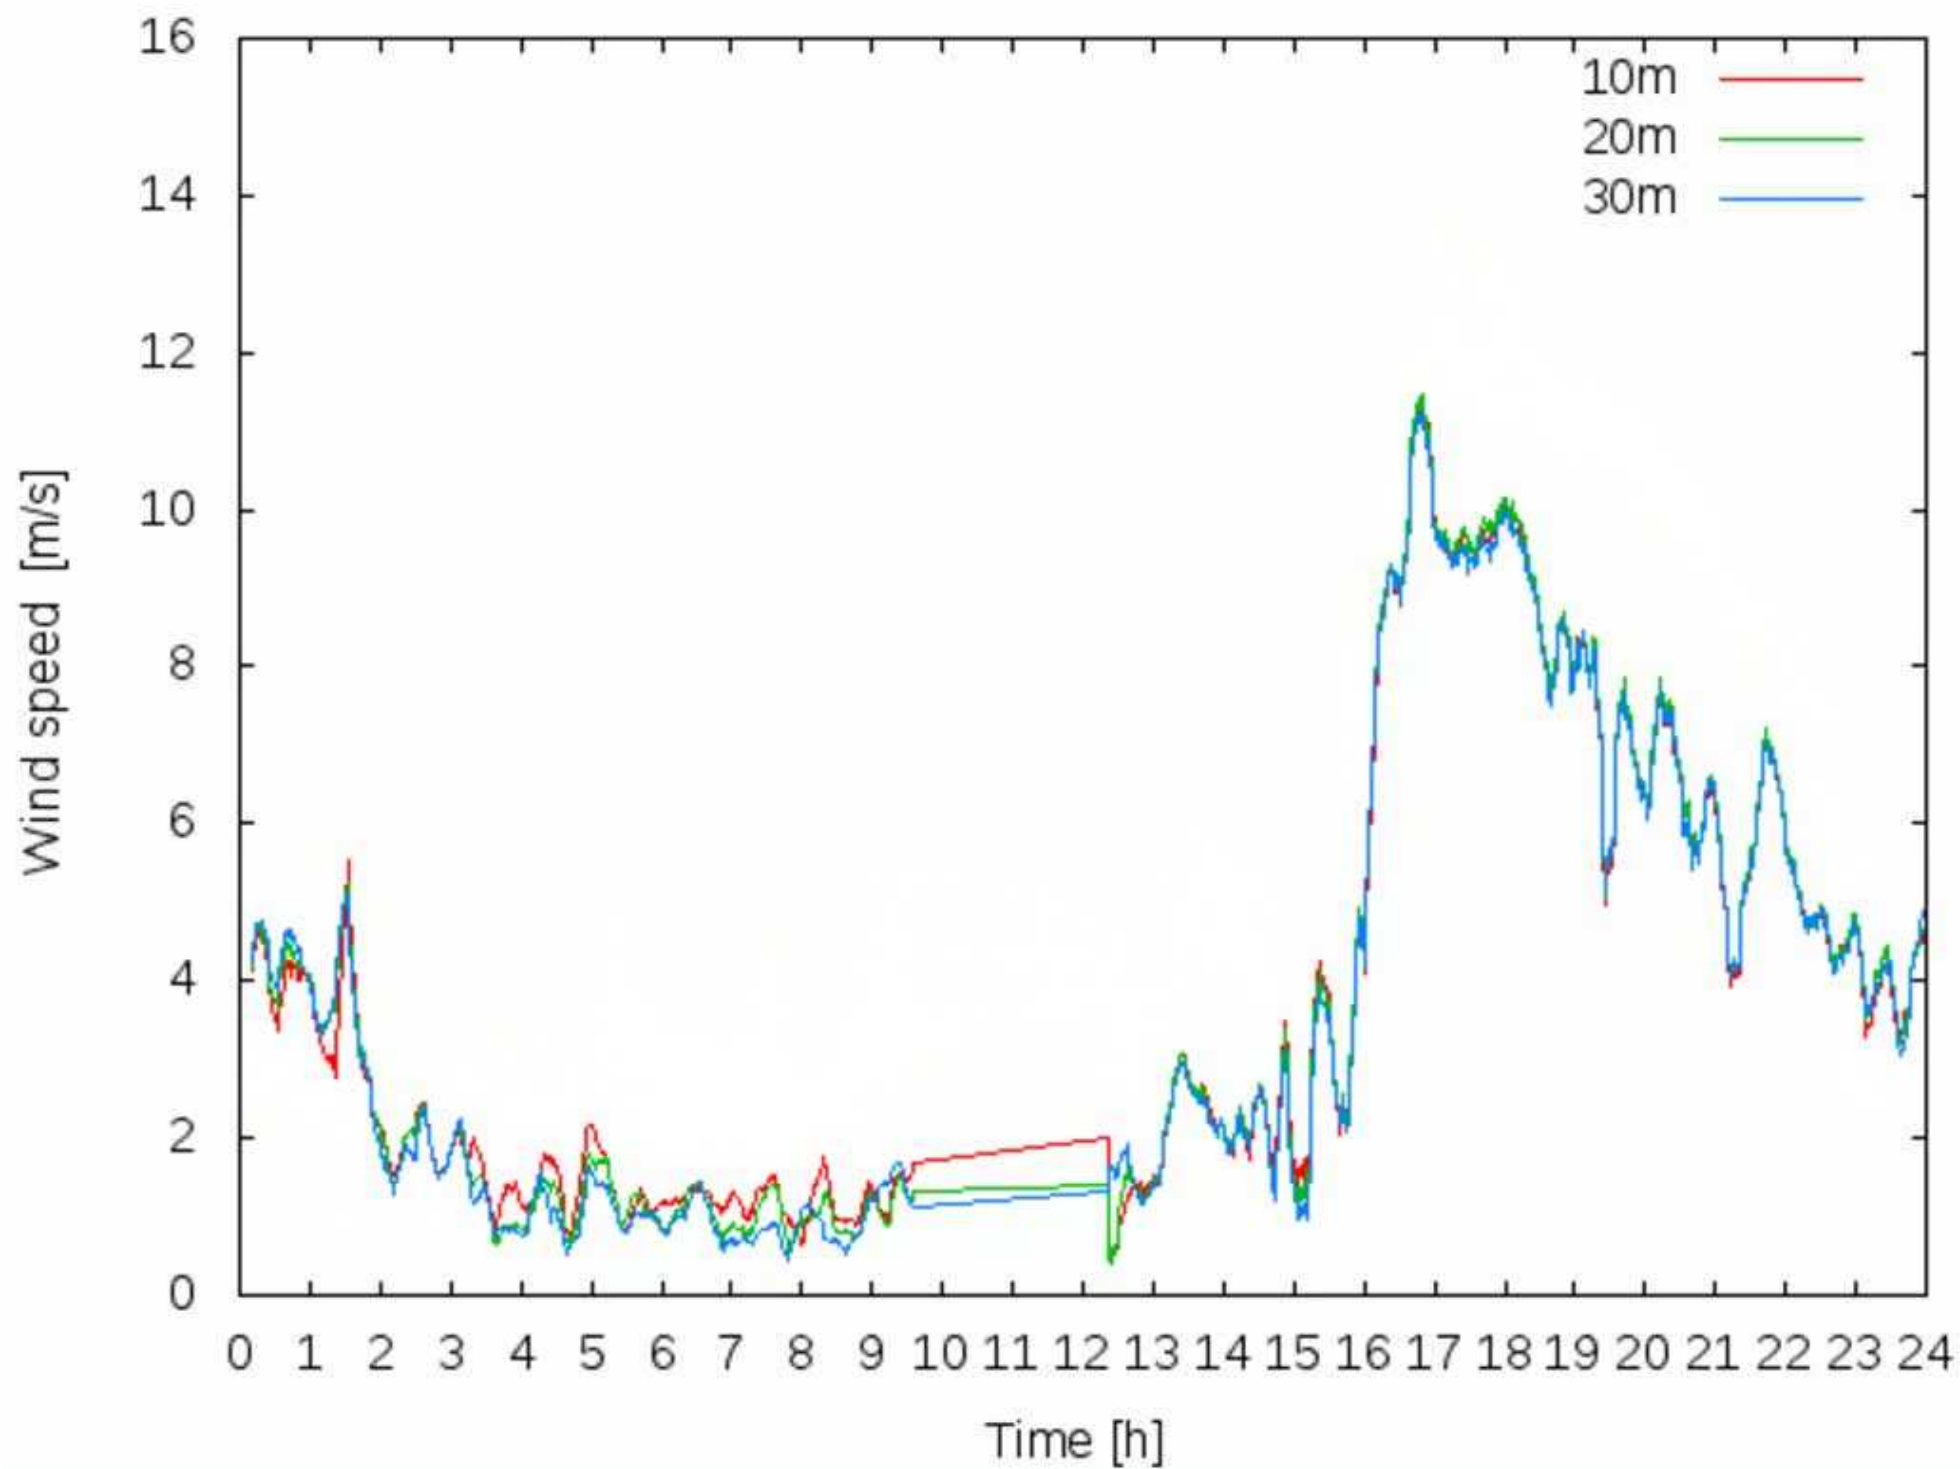

# Distribution of strong wind time

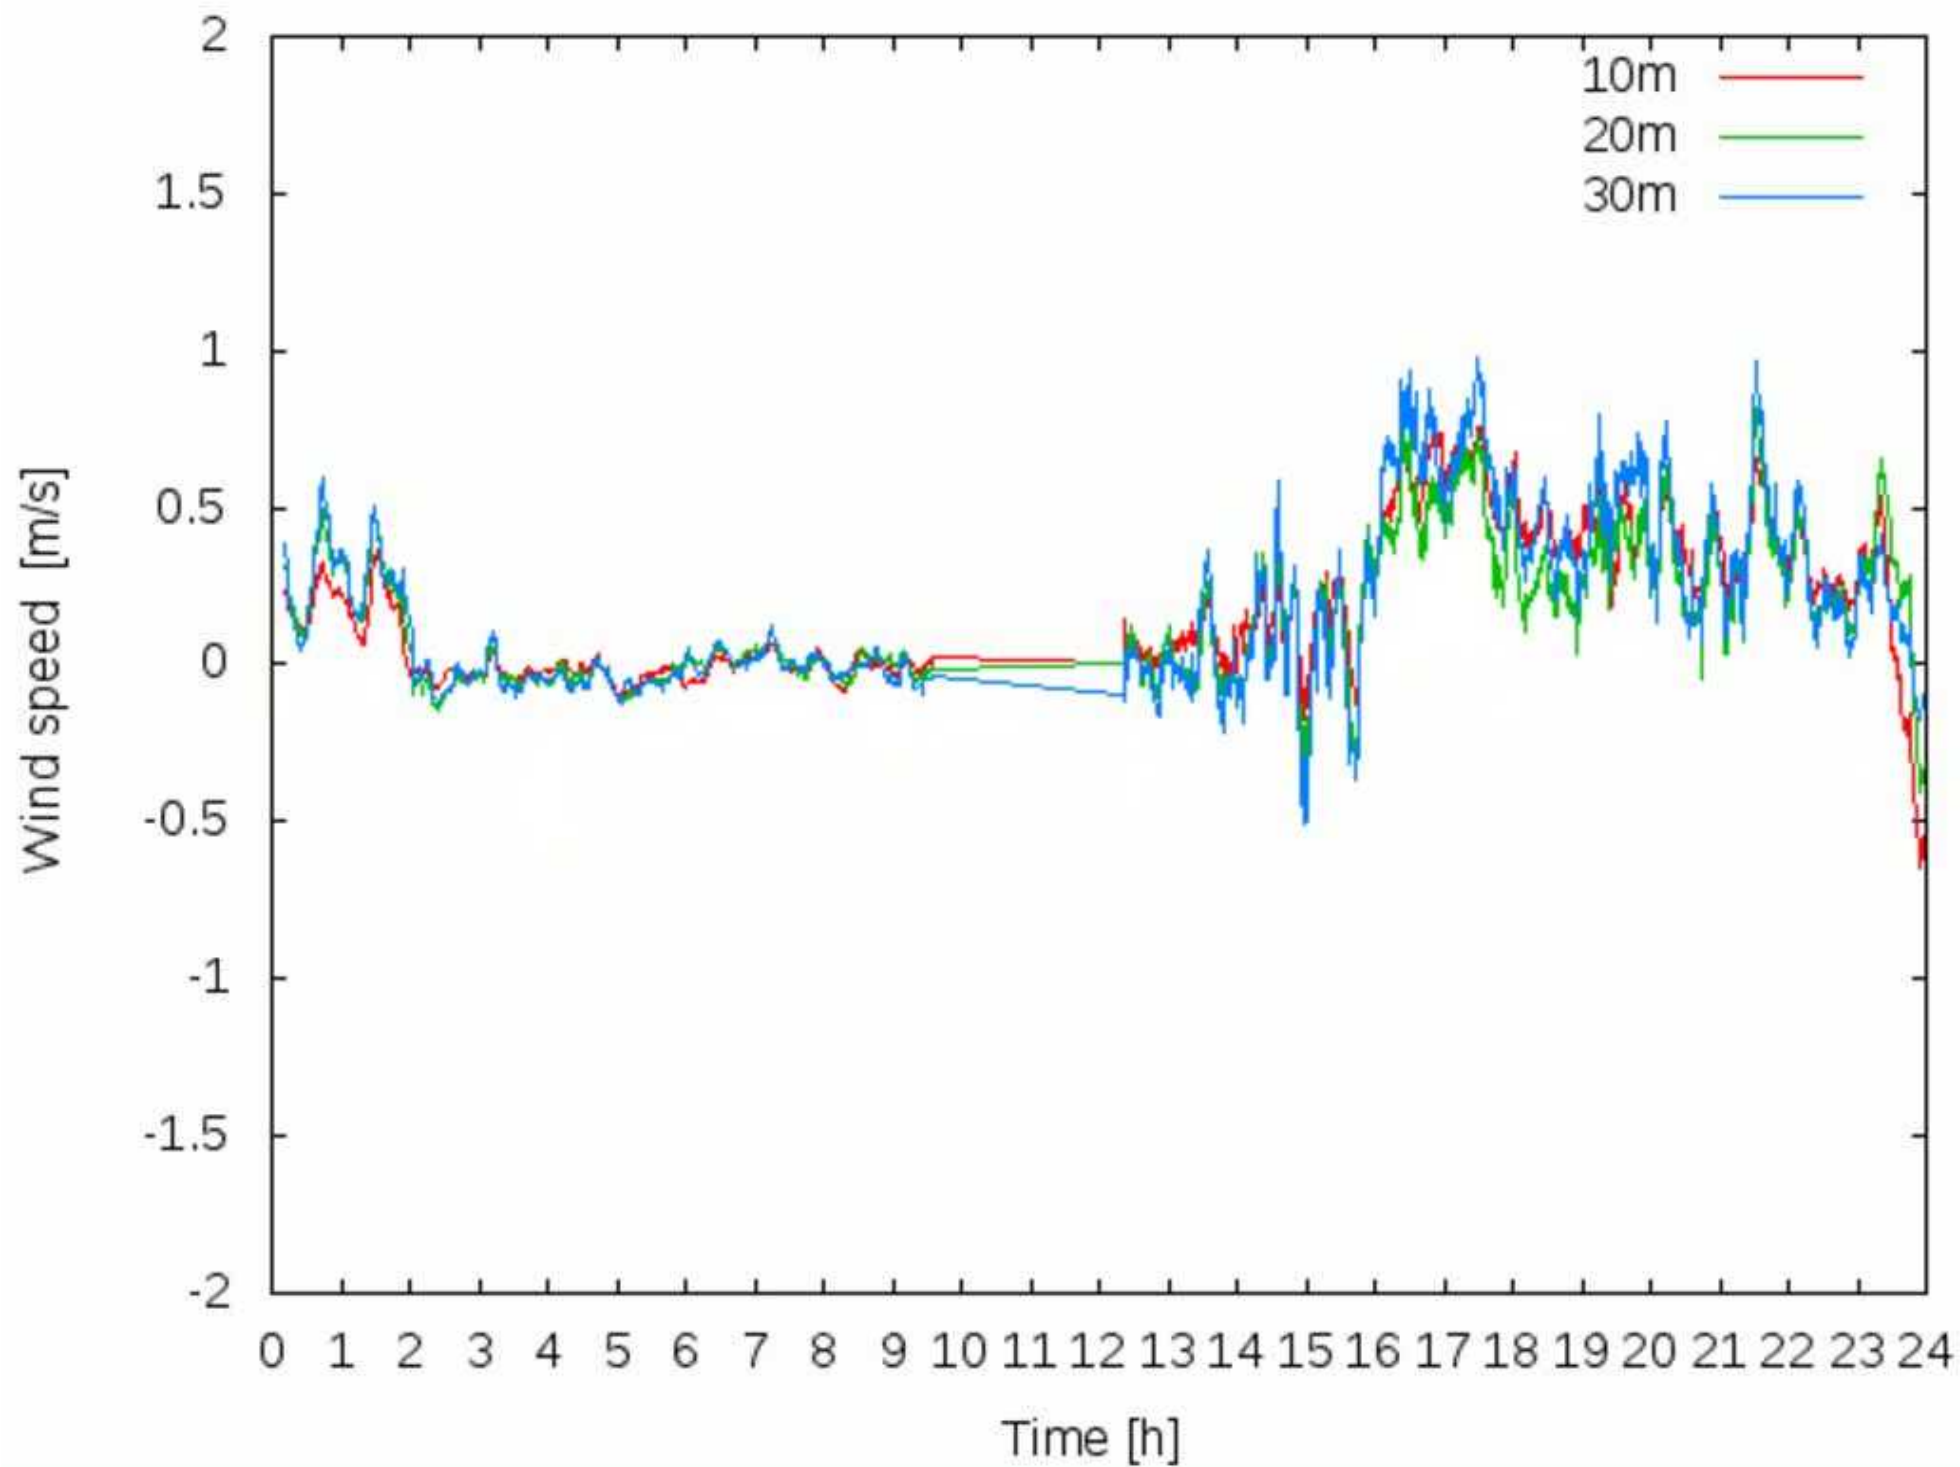

# Data from 30 meter tower

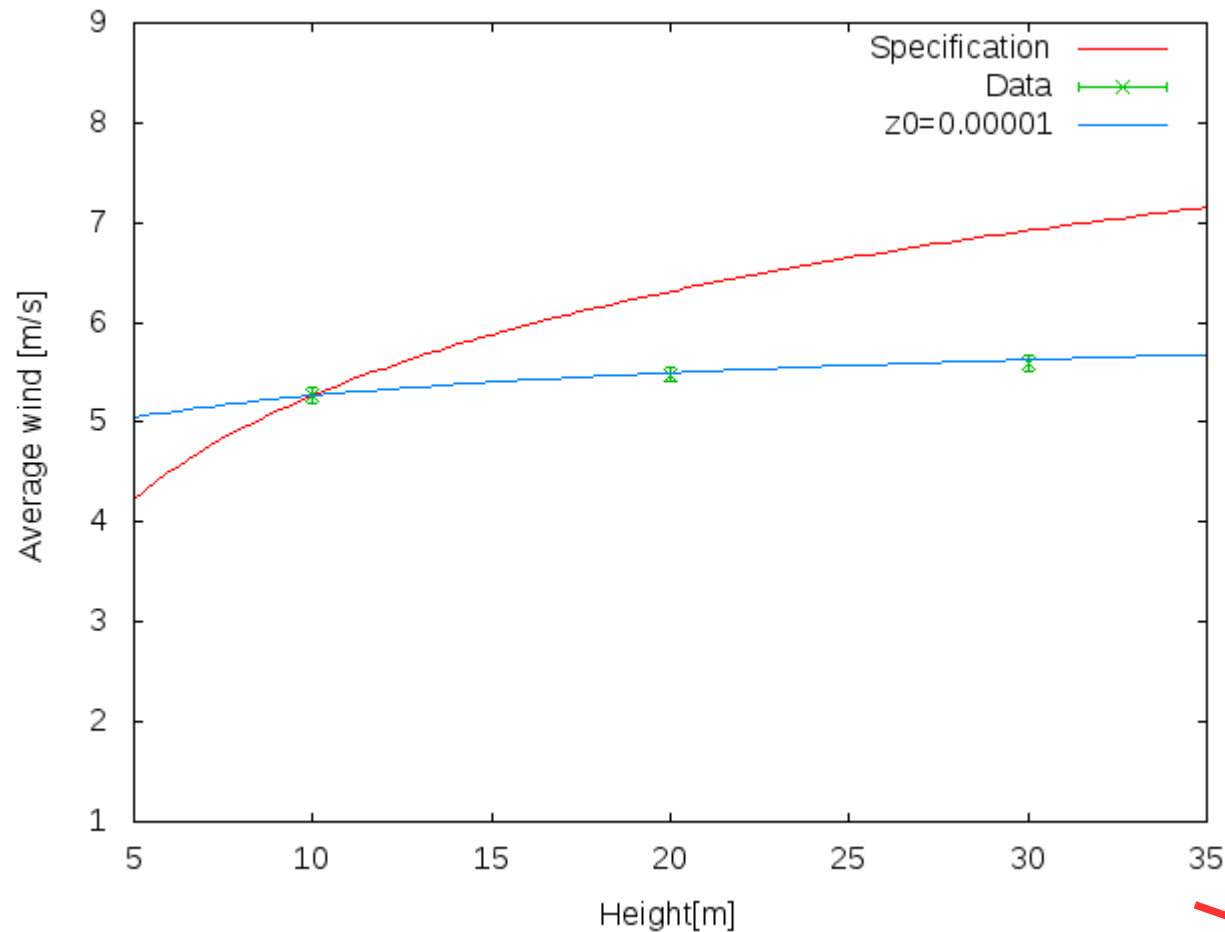

- Wind profile
- Wind turbulence

# Wind profile

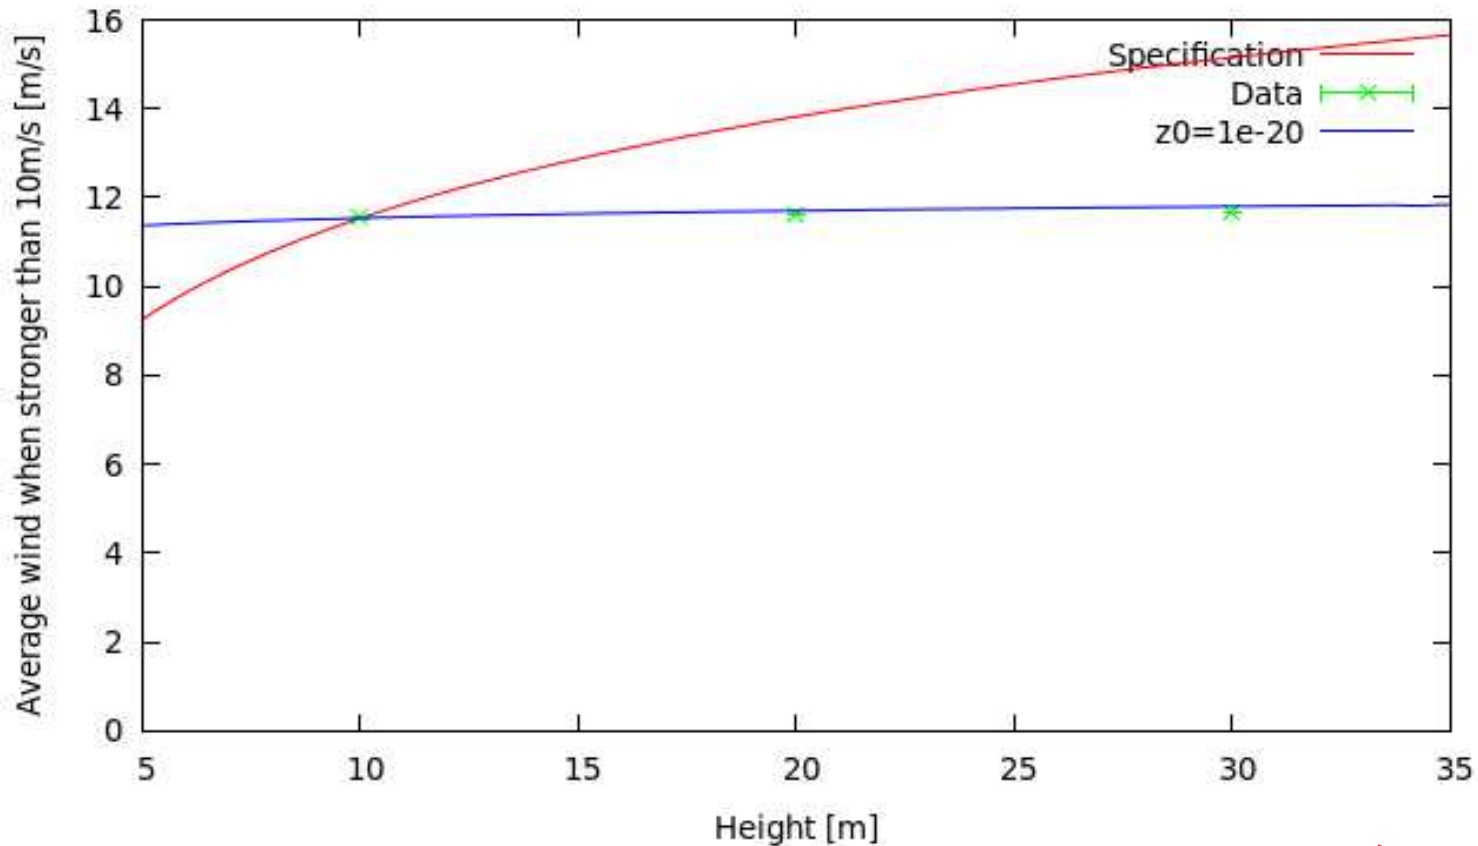

$$V(h) = V(10\text{m}) \times \frac{\ln(h/z_0)}{\ln(10\text{m}/z_0)}$$

~~$z_0 = 0.3 \text{ m}$~~

$z_0 = 10^{-5} \text{ m}$

# Wind profile for strong winds

$$V(h) = V(10\text{m}) \times \frac{\ln(h/z_0)}{\ln(10\text{m}/z_0)}$$

~~$$z_0 = 0.3 \text{ m}$$~~

$$z_0 = 10^{-20} \text{ m}$$

# Wind power spectrum

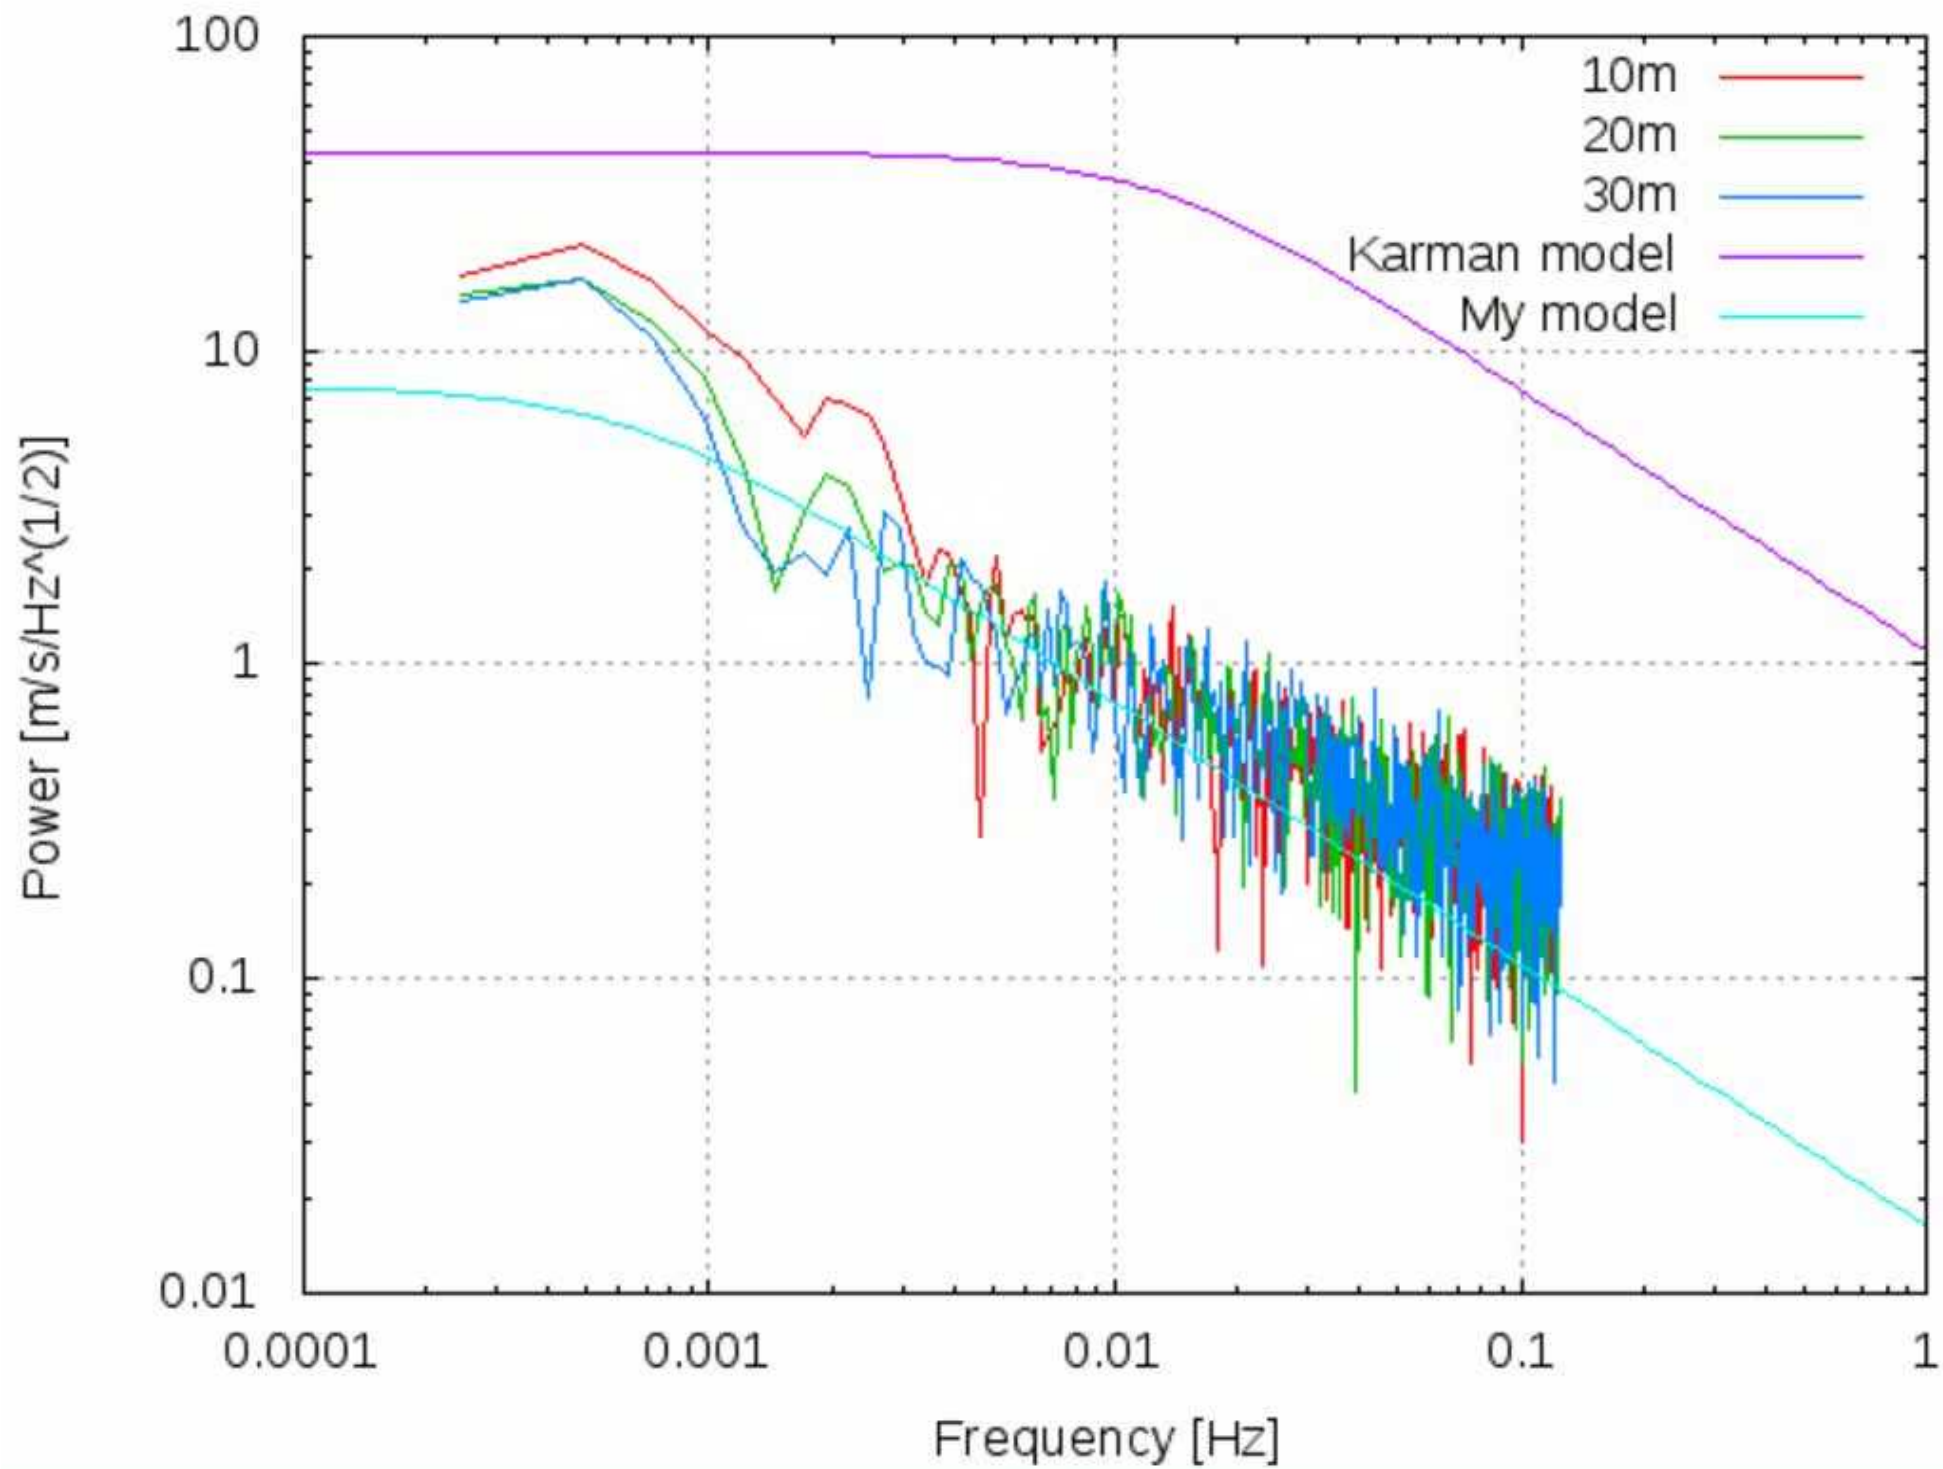

$$s(f) = (IU)^2 \frac{4L/U}{(1 + 70.8(fL/U)^2)^{5/6}}$$

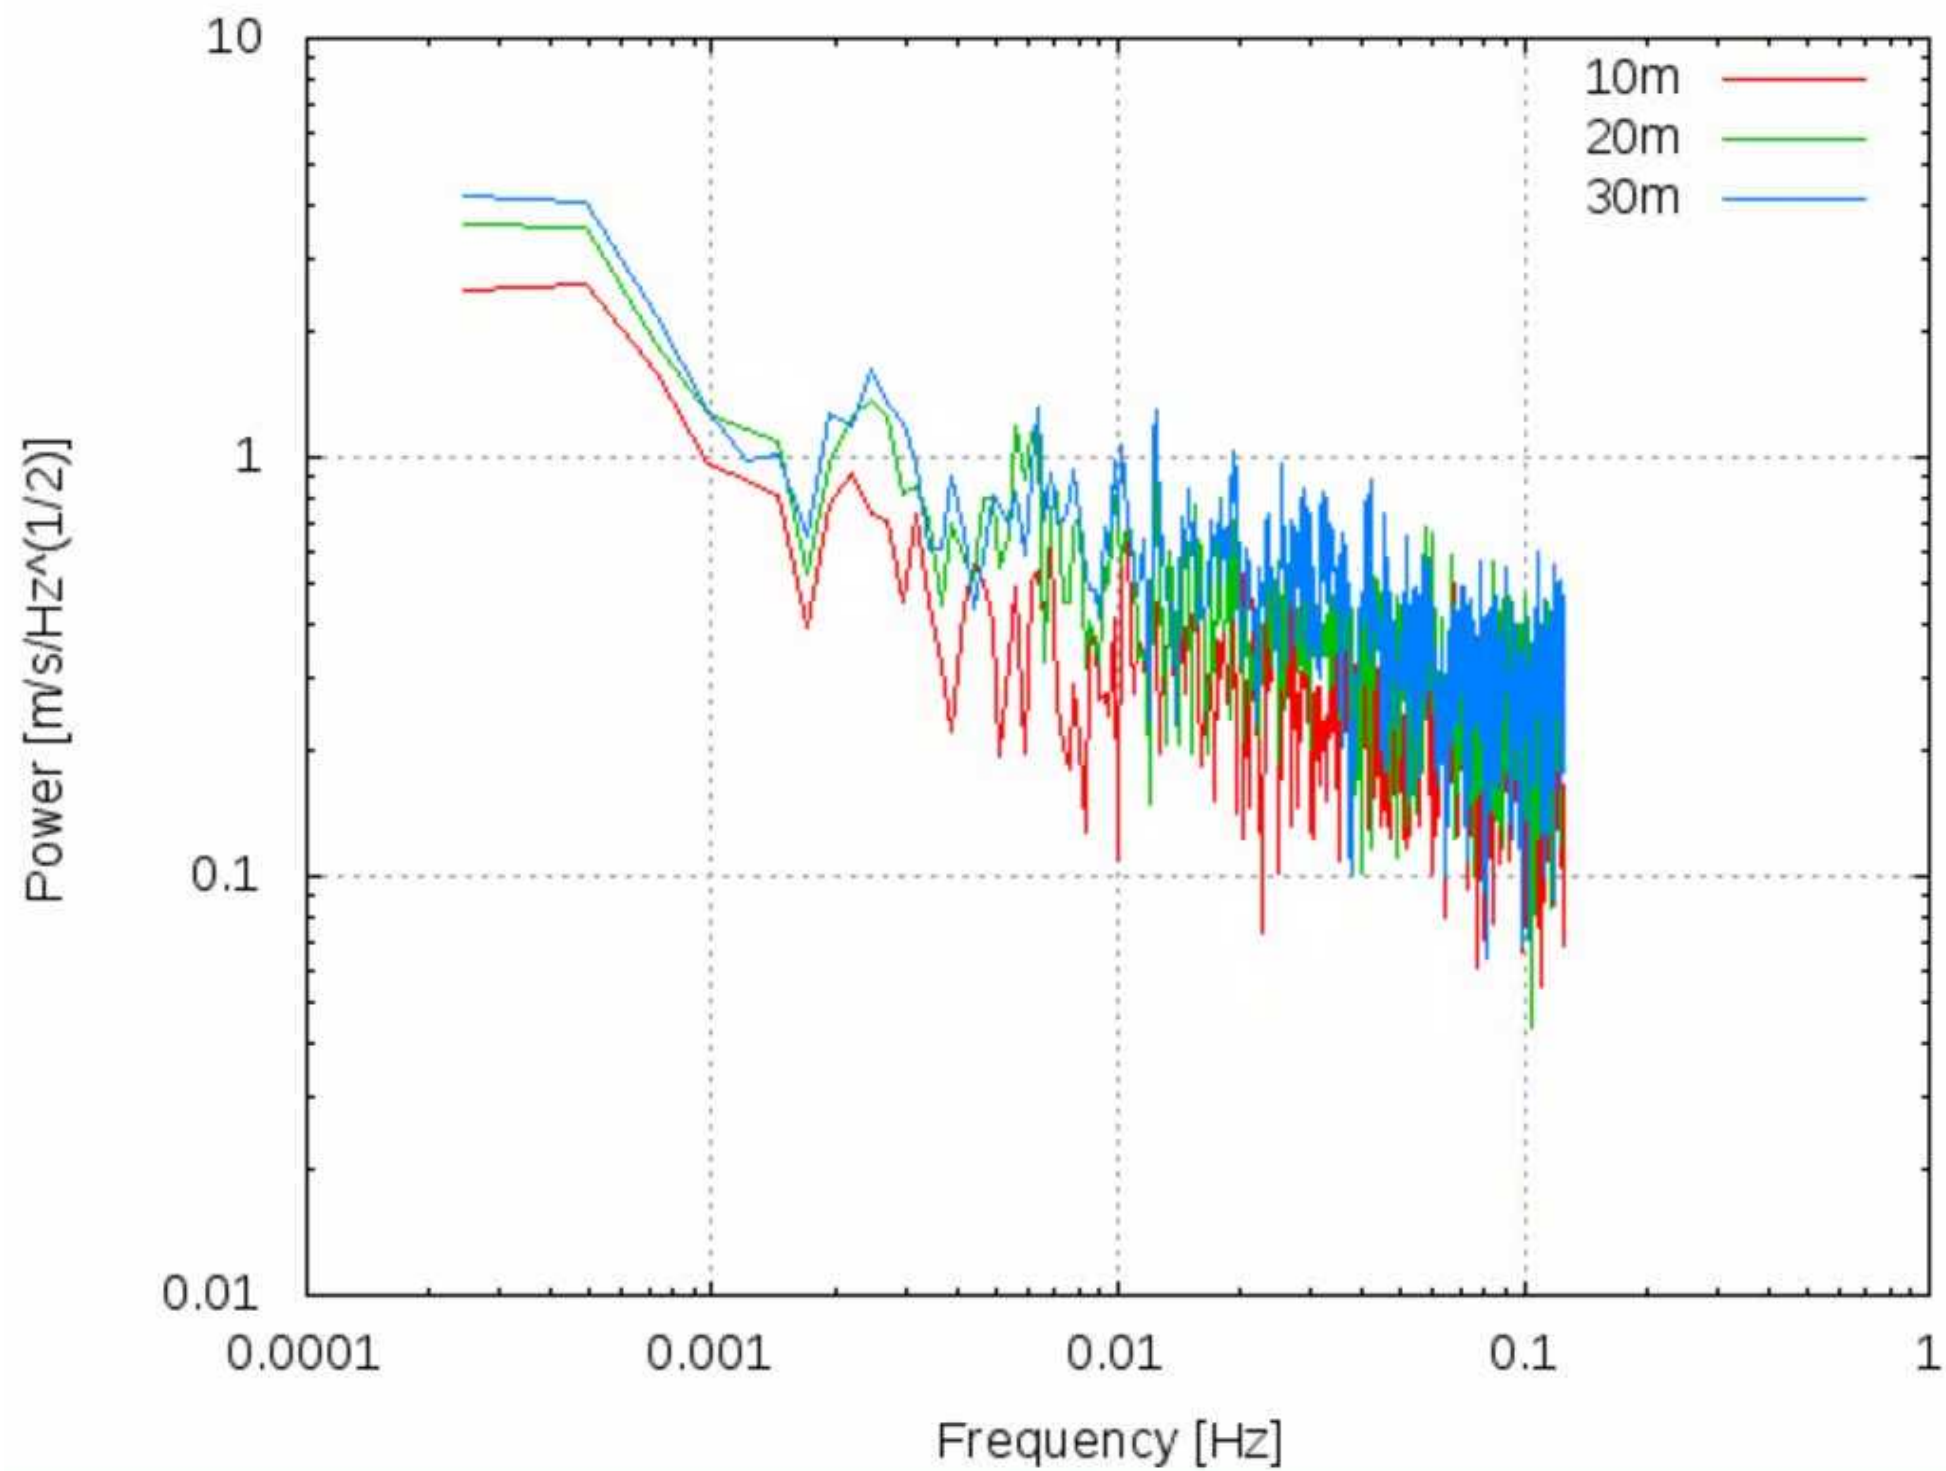

Specification (Karman model)

$$I = 0.25 \quad L = 50m \quad \text{Wrong!}$$

My model – roughly fitting data.

$$I = 0.01 \quad L = 1000m$$

# Wind conclusions

- Wind profile nearly flat: the air moves at nearly the same speed at all heights
- Wind power spectrum much flatter than assumed for construction
- Probably the observation state requirement can be relaxed, and the observation time will be increased

# Summary

- Temperature is within operating range
- Humidity is typically low but not a big problem
- Strong wind episodes but the observing condition can likely be relaxed
- Still analyzing seismic data

# Next steps

- Revive the ASC complex power
- Move the 30 meter tower to the actual LST location
